

Global Object

Ye kya hai?

Global object me wo cheezein hoti hain jo **kahin se bhi** accessible hain, jaise built-in functions aur environment ki cheezein.

Jagah	Naam
Browser	<code>window</code>
Node.js	<code>global</code>
Har jagah (standard)	<code>globalThis</code>

Agar code alag-alag environments me chalana hai to `globalThis` use karo.

```
javascript
alert("Hi");
window.alert("Hi"); // dono same
```

`var` vs `let` (global level par)

Browser me (modules ke bina):

- Global `var` aur function declaration **window ki property** ban jaate hain.
- Global `let` / `const` **nahi** bante.

```
javascript
var a = 5;
let b = 10;

window.a; // 5
window.b; // undefined
```

Ye sirf purani compatibility ke liye hai. Is par depend mat karo. Modern code me modules use hote hain jahan ye hota hi nahi.

Kuch sach me global chahiye to

Seedha `window` par property bana do:

```
javascript
```

```
window.currentUser = { name: "John" };
```

Global variables kam se kam rakho

Function ko input parameters do aur output return karwao. Isse code samajhna aur test karna aasan hota hai.

Polyfill me use

Global object se check karte hain ki koi modern feature browser me hai ya nahi.

javascript

```
if (!window.Promise) {  
  // purana browser: yahan apna version bana do (polyfill)  
}
```

Yaad rakho

- Global object = sab jagah available cheezein.
- Universal naam `globalThis`.
- Global values sirf tab rakho jab sach me zaroori ho.
- Clear code ke liye `window.x` likho.
