

Interaction: alert, prompt, confirm - Simple Hinglish Summary

Source: <https://javascript.info/alert-prompt-confirm>

Main baat

Browser me user se interact karne ke liye 3 functions hain: `alert`, `prompt` aur `confirm`.

1. `alert`

- Message dikhata hai aur user ke "OK" dabane ka wait karta hai.

```
javascript  
  
alert("Hello");
```

- Ye mini-window **modal window** kehlati hai. **Modal** ka matlab: jab tak user is window ko band nahi karta (OK nahi dabata), tab tak wo **page ke baaki hisse se interact nahi kar sakta**.

2. `prompt`

User se **text input** maangta hai.

```
javascript  
  
result = prompt(title, [default]);
```

- `title` → user ko dikhane wala text
- `default` → input field ki initial value (**optional**, square brackets `[...]` ka matlab optional hota hai)
- Window me hota hai: message, input field, aur **OK / Cancel** buttons.

Result kya milta hai:

- User kuch type karke **OK** dabaye → **wo text** milta hai
- User **Cancel** dabaye ya **Esc** dabaye → `null` milta hai

```
javascript  
  
let age = prompt('How old are you?', 100);  
  
alert(`You are ${age} years old!`); // You are 100 years old!
```

Internet Explorer ke liye tip

IE me agar `default` nahi doge to input field me `"undefined"` likha aa jata hai. Isliye **hamesha dusra argument do:**

```
javascript

let test = prompt("Test", ''); // IE ke liye
```

3. `confirm`

User se **yes/no question** poochta hai.

```
javascript

result = confirm(question);
```

- Window me **question** aur do buttons: **OK** aur **Cancel**.
- **OK** dabane par → `true`
- **Cancel** / **Esc** dabane par → `false`

```
javascript

let isBoss = confirm("Are you the boss?");

alert( isBoss ); // OK dabaya to true
```

Summary

Function	Kaam	Return value
<code>alert</code>	Message dikhata hai	Kuch nahi
<code>prompt</code>	Text input maangta hai	Text, ya Cancel/Esc par <code>null</code>
<code>confirm</code>	OK/Cancel poochta hai	OK par <code>true</code> , Cancel/Esc par <code>false</code>

Teeno modal hain: script ka execution **pause** ho jata hai aur user page ke baaki hisse se tab tak interact nahi kar sakta jab tak window band na ho.

Do limitations

1. Window ki **exact location browser decide karta hai** (aam taur par center me).
2. Window ka **look browser decide karta hai**, hum badal nahi sakte.

Ye simplicity ki keemat hai. Better-looking windows ke liye dusre tarike hain, lekin agar zyada style ki zarurat nahi to ye methods bilkul theek hain.

Practice Task

Ek page banao jo naam poochhe aur usse dikhaye:

```
html
```

```
<!DOCTYPE html>
```

```
<html>
```

```
<body>
```

```
  <script>
```

```
    'use strict';
```

```
    let name = prompt("What is your name?", "");
```

```
    alert(name);
```

```
  </script>
```

```
</body>
```

```
</html>
```
